Emergency Lumen Output

How to Estimate Delivered Lumens in Emergency Mode

Use the formula below to estimate the delivered lumens in emergency mode

$$\text{Delivered Lumens} = P \times \text{LPW}$$

P = Output power of emergency driver

LPW = Lumen per watt rating of the luminaire. (See charts on pages 6 and 7)

The LPW rating is also available at [Designlight Consortium](#)

P = 10 watts for E10WCP

P = 15 watts for E15WCPR

P = 23.1 watts for BSL722CR

P = 30 watts for IE30WCPHER

Emergency Lumen Output Example - 15 Watt Battery

COMPONENTS & OPTIONS DATA

Sensors

Occupancy-only mode that controls on/off and dimming of the fixture. Photocell option reads daylight levels to dim lights or prevent start-up.

Dimming drivers

Drivers use 0-10V protocol with dimming down to 10% lumen output.

AO

Field adjustable output dimming.

Optics

Standard prismatic, borosilicate glass that doesn't fade or degrade. Optional frosted optics provide even greater visual comfort. Injection molded acrylic lens available in wide and narrow.

Wire Guard

Steel wire guard available to further protect fixture from impact.

Hook and cord

3/4" hub standard. Multiple hooks and other mountings available. Cord sets can be specified with or without plug.
